

Summary

Vue Instances & Components

You can create **re-usable instances**, which act like **custom HTML elements**: So-called “**components**”

Components can be created with **Vue.component()** and they should have a **multi-word tag**

Vue Component Templates

Vue components **do not control HTML elements** via “**el**”, instead you use the “**template**” option

Inside the template, you must only have **one root element** (with Vue 2.x)

Component Configuration

Generally, Vue components take the **same options** as “regular” Vue instances (= “root Vue instances”)

But the “**el**” option is **not supported** and the “**data**” option should hold a method that **returns a new object**

Vue Component Interaction

Every Vue component instance **works standalone, independent** of other component instances

Communication will be covered later...
